

COMPROMISED INFORMATION MONITORING

Decrease the Likelihood of Identity Theft

LookingGlass Compromised Information Monitoring (CIM) provides early warning of compromised account credentials, compromised credit card numbers and compromised Social Security Numbers discovered in the wild. With this service, organizations have global coverage of leaked personal information, helping to decrease the likelihood of end-users becoming victims of identity theft.

Compromised Information Monitoring helps prevent:

- Identity theft
- Unauthorized account purchases
- Unauthorized lines of credit
- Blackmail or extortion schemes

In many cases, the impact of a data leak is not only the initial out-of-pocket financial cost, but also spans to financial costs associated with trying to restore reputation and reverse erroneous transactions.

CIM leverages proprietary LookingGlass collection methods to continuously discover, clean-up and aggregate various types of formats of compromised data dumps, into an easily consumable format for direct and secure consumption. Sources of collection include: honeypots, malware drop sites, underground forums, botnet servers, paste sites, Deep Web and Darknet sources and LookingGlass proprietary data crawling and collection processes.

By comparing specific data points with recently discovered compromised data, LookingGlass systems discover and analyze data to indicate if a match has been found for a specific personally identifiable information (PII) data point. If a match is found, there is a high likelihood of a compromise.

Organizations can use this information to take further preventative measures and/or notify their customers, employees, and partners that a potential breach has occurred.

Licensing Information – DATA-CTIG-PII-LOOKUP: Personally identifiable information (PII) lookup service.

FEATURES

BENEFITS

Global Coverage

- Discover compromised credentials from around the world through dozens of sources including the Deep web and Darknet.

Early Warning Security Alerts

- Quickly learn of personal information leaks through secure and encrypted data notifications.
- Reduce risk of identity theft, unauthorized account purchases, opening unauthorized lines of credit, and exposure to blackmail or extortion schemes.
- Reduce costs associated with reputation and reversing false transactions.

Proprietary Data Crawling and Collection Processes

- Continuously discover compromised personal information for real-time coverage of data leaks.

Password Reset

- Automatic notification of passwords that need to be reset based on detection of a compromised account.

Authentic Compromised Data

- Save time and eliminate data duplication through quality controls such crosschecking overlaps of compromised data with previously discovered data dumps.

ABOUT LOOKINGGLASS CYBER SOLUTIONS

LookingGlass Cyber Solutions delivers unified threat protection against sophisticated cyber attacks to global enterprises and government agencies by operationalizing threat intelligence across its end-to-end portfolio. Scalable threat intelligence platforms and network-based threat response products consume our machine-readable data feeds to provide comprehensive threat-driven security. Augmenting the solutions portfolio is a worldwide team

of security analysts who continuously enrich our data feeds and provide customers unprecedented understanding and response capability into cyber, physical and 3rd party risks. Prioritized, relevant and timely insights enable customers to take action on threat intelligence across the different stages of the attack life cycle.
